Hard to pick one technology to focus your time and energy on? Well, what's wrong with both? Front end is a category of web development that includes the tools and skills which allow developers to build HTML, CSS, and Javascript, and Google's Chrome has unsplashed front end "so far" that it could be a dog.

Let's focus on the parts of front end development. While each of these tools has its own set of skills, learning the basics of each will give you a good foundation for building a career in front end development.

Front end development uses HTML, CSS, and Javascript to create the website and user experience (Google's Material Design). The tools they use to make that end-user experience are referred to as front end frameworks. Front end developers also need to know how to optimize their code for speed and performance, and they use the engineer who designs and creates the systems that make it very fast and easy to open and closes the website. Front end developers also need to know how to make their code work on different devices and browsers, and they use a set of tools called preprocessors to make that easier. Finally, front end developers need to know how to make their code easy to read and maintain, and they use a set of tools called preprocessors to make that easier.

Our contributor Joseph Zimmerman of Hackreactor explains that front end development is a job that can be as hard or boring as the developer plus are plan, starting out with little, HTML and CSS and then adding in Javascript and front end frameworks as they get more comfortable with the tools.

HTML & CSS

HTML (Hyper Text Markup Language) and CSS (Cascading Style Sheets) are the core tools building the front end of a website. HTML is used to create the structure of a webpage, and CSS is used to make it look good with a color-coordinated palette and nice-looking fonts. You can start with Google's in page editor of HTML.

Javascript

Javascript lets you add a lot more functionality to your websites. You can add cookie cutter UI widgets, applications using nothing more than HTML, CSS, and Javascript (or JS, Sorry). Or, the more basic stuff, like a form that checks to see if the user has entered a valid email address. Learn the basics of Javascript and you can start building your own website.
